                                                          Message methods
read proto description files
                                                                         Indicates if a message has a given field.
                                                               has
> #line 44 "RProtoBuf-quickref.Rnw"
                                                               clone
                                                                         Creates a clone of the message
```

```
> readProtoFiles( "somefile.proto" )
> readProtoFiles( dir = somedir )
> readProtoFiles( package = AnRPackage )
```

### create a message

```
> #line 52 "RProtoBuf-quickref.Rnw"
> message <- new( tutorial.Person, id = 0,
          name = "Romain Francois",
          email = "francoisromain@free.fr" )
```

# serialize a message to a file or binary connection

```
> #line 60 "RProtoBuf-quickref.Rnw"
> # to a file
> tf1 <- tempfile()</pre>
> message$serialize( tf1 )
> tf2 <- tempfile()</pre>
> con <- file( tf2, open = "wb" )</pre>
> message$serialize( con )
> close(con)
> # retrieve the payload
> message$serialize( NULL )
 [1] 0a 0f 52 6f 6d 61 69 6e 20 46 72 61 6e 63 6f
```

```
Indicates if a message has all its required fields set
isInitialized
                 serialize a message to a file or a binary connection
  serialize
                 or retrieve the message payload as a raw vector
    clear
                 Clear one or several fields of a message, or the
                 entire message
     size
                 The number of elements in a message field
                 The number of bytes the message would take once
  bytesize
                 serialized
                 swap elements of a repeated field of a message
     swap
                 set elements of a repeated field
     set
    fetch
                 fetch elements of a repeated field
     add
                 add elements to a repeated field
     str
                 the R structure of the message
as.character
                 character representation of a message
                 character representation of a message (same as
  toString
                  as.character)
    update
                  updates several fields of a message at once
 descriptor
                 get the descriptor of the message type of this mes-
```

```
> #line 124 "RProtoBuf-quickref.Rnw"
> writeLines( message$toString() )
name: "Romain"
email: "francoisromain@free.fr"
```
